Climate Change Adaptation & Communities

Communities are on the frontlines of the
Climate Change Challenge.

When you must meet any challenge, including climate change, knowing where your risks are is an important element in helping with planning to meet the challenge.

What the mapping might look like varies from community to community depending on hazards and vulnerabilities. How you might get the mapping done might vary depending on what mapping is already done.

Can we help you with your climate change challenge?

Some sources for information to complete hazard or permafrost mapping in your community:

- Community Members especially elders
- Satellite Images
- Mapping from ENR and MACA
- Geotechnical Reports (check with Public Works, GNWT)
- Geotechnical Consultants
